

SPECIFICATION AMENDMENTS

Rewrite the two paragraphs between lines 1 and 18 of page 5 as follows:

According to another aspect of the invention, a latch between the cover and the base releasably secures the cover in the closed position and ~~including~~ includes a grounded element on the base engageable with the cover only in the closed position. Thus when the cover is latched, it is grounded directly by the latch. The grounded element is ~~an~~ a latching tab fixed to the base. More particularly, the tab is formed with a tongue engageable with the cover and holding it against the base only in the closed position. The base includes a contact connected to the grounded support and to the tab and a part imbedded in the base.

In accordance with yet another aspect of the invention, a hinge has a part on the base connected to the grounded support and a part ~~on the~~ integral with the cover in electrically conductive engagement with the part on the base. This hinge functions at all times to maintain the cover grounded, even when open. Of course any of these grounding systems - via the ground contacts, via the latch, and via the hinge - can be used alone or in addition to any of the other systems.
